Help_u_understand

1. The "Time Window" Strategy

- **Old Way:** alert immediately

- **New Way: Time Duration Check**. The system now waits for the condition for a specific time (2 minutes) before sending an alert. If the value returns to normal within that window, the timer resets.

2. Steps and **GPS Location (try2.py)**

4.Report Generator(final destination)

- API Endpoint: /get-report/{id} ….   generates a visual report.

- Active periods in **Grey** and Resting Anomalies with **Red Dots**
